PhD Thesis Today Doughnut Doctor of Philosophy The University of Melbourne THE UNIVERSITY OF MELBOURNE

1.3

Abstract

This is where you should write your thesis abstract. It is typically a concise summary of your work, often limited to

I, , declare that this thesis titled, ‘title’ and the work presented in it are my own. I confirm that:
The thesis comprises only my original work towards the except where indicated in the preface;
due acknowledgement has been made in the text to all other material used; and
the thesis is fewer than the maximum word limit in length, exclusive of tables, maps, bibliographies and appendices as a

The preface must contain:

- a detailed description of the contributions the candidate has made to any co-authored publications, draft publications, or where a publication or part of a publication has been used, the place in the thesis where the content has been incorporated;
- a description of any work in the thesis that has been submitted for other qualifications;
- a description of any work that was carried out prior to enrolment in the course;
- a description of whether any digital editorial assistance or generative AI tools were used in preparing the thesis, and the use of Generative AI was used in this thesis to improve clarity and expression. Logs of use including dates and input text are provided.
- Generative AI was used to create diagrams xx, yy. The prompts and applications used for the generation of these diagrams are provided.
- AI tools were used to generate the data visualisation shown in diagram xx. I have confirmed that the visualisations are accurate.
- a description of whether any third-party human assistance was provided in preparing the thesis and whether these parties are named in the citation and publication status of all publications incorporated into the thesis and appendices using these categories:
- Unpublished material in preparation for publication but not yet submitted, including preprints;
- Submitted for publication to [publication name] on [date];
- In revision following peer review by [publication name];
- Accepted for publication by [publication name] on [date];
- Published by [publication name] on [date].
- an acknowledgement of all sources of funding, including grant identification numbers and acknowledgement of Australian Government funding.

latex name=LaTeX, description=A document preparation system
svm name=SVM, description=Support Vector Machine, first=Support Vector Machine (SVM)

 ω angular frequency rads^{-1}

Introduction

This chapter serves as an introduction to the thesis template and demonstrates various features, including citations

Citations and Bibliography

This template uses ‘bibtex’ for bibliography management, which offers great flexibility. Here are some examples of

`\cite{key}`: Basic citation, e.g., [?].

`\parencite{key}`: Parenthetical citation, e.g., Reference2.

`\textcite{key}`: Textual citation, e.g., Reference3 showed that...

`\autocite{key}`: Context-aware citation, e.g., Hao2023.

Multiple citations: [?, ?].

Citations with page numbers: See [?, p. 15] for details.

Another example: [see Chapter 3]Lamport1986 provides an overview.

The bibliography is automatically generated at the end of the document. Make sure to run LaTeX, then Biber, then LaTeX

Figures and Subfigures

Figures are crucial in a thesis. This template uses the ‘graphicx’ package for including images and ‘subcaption’ for

`[htbp] [thick,->] (0,0) -- (4,0) node[anchor=north west] x; [thick,->] (0,0) -- (0,4) node[anchor=south east] y; [scale=`

`Figure fig:tikz_{}_example shows a simple figure. For more complex layouts, subfigures can be used, as shown in Figure fig:{}_`

`[htbp] [b]0.45 [width=]unimelb_logo.eps First subfigure.`

$x + y + z = w$ The ‘gather’ environment can be used for centering multiple equations: $\int_0^\infty e^{-x^2} dx = \frac{\sqrt{\pi}}{2}$

$\sum_{n=1}^\infty \frac{1}{n^2} = \frac{\pi^2}{6}$ Refer to ch:introduction for more examples, or a specific sec:equations.

Code Listings

The ‘listings’ package is used for typesetting code. Styles for Python and Matlab are predefined in ‘Thesis.cls’. List

`[language=Python, caption=A simple Python function., label=lst:python_{}_example]def greet(name) : """This function`

Example usage `greet("World")`

This concludes the demonstration of common thesis elements.

An Appendix
